Fat Content of Ground Beef and Sausage - 1985

By Lester Hankin

Many consumers are concerned with their intake of fat, and fat in meat comprises about 8% of man's caloric intake (1). Ground beef is a favorite meat and accounts for about 30% of all processed beef (2). Under Connecticut Regulations ground beef can contain up to 30% fat. Other favorite meats are pork sausage, which can contain up to 50% fat, and Italian sausage, which can contain up to 35% fat.

In 1982-1983 we found the fat content of ground beef to range from 7 to 40% (3). We have continued to test meats for compliance with State and Federal Regulations and now report tests on ground beef and sausage samples collected in 1985.

For ground beef, Connecticut Regulations (4) are:

"Chopped beef or ground beef shall consist of chopped fresh and/or frozen beef with or without seasoning and without the addition of beef fat as such, shall not contain more than 30% fat, and shall not contain added water, binders, or extenders. Hamburger shall consist of chopped fresh and/or frozen beef with or without the addition of beef fat as such and/or seasoning, shall not contain more than 30% fat, and shall not contain any added water, binders, or extenders."

If the label on ground beef specifies no fat content, then the meat must not contain more than 30% fat. If, however, the label states a specific amount of fat less than 30%, as, for example, "not more than 18% fat", then the meat must comply with the label. Merchants sometimes state on the label that the ground beef contains not less than a certain percentage of lean. The interpretation of such labels by the

Commissioner of Consumer Protection based on Regulations (4) and Statutes (5) is that 100 minus the declaration of percent lean is equal to the percent fat. Thus, for example, a claim of not less than 82% lean means not more than 18% fat. If excess fat is found the product is misbranded under Connecticut Regulations (4) and Statutes (5).

Ground beef is sometimes labeled as "lean", "extra lean" or "diet lean" to imply a lower fat content, but no Connecticut Regulations pertain to such designations nor is there any way for the consumer to relate these designations to fat content. Ground beef is sometimes labeled as to cut of meat, for example, "ground chuck", "ground sirloin", or "ground round." No Connecticut Regulations pertain to such designations. Although chuck, round, and sirloin specify a particular cut of meat, once the meat is ground there is no way to determine the particular cut of meat that was used.

For sausage, Connecticut follows the Federal Regulations (6).

"Fresh pork sausage is sausage prepared with fresh pork or frozen pork, or both, but not including pork byproducts. The finished product shall not contain more than 50% fat.

Fresh beef sausage is sausage prepared with fresh beef or frozen beef, or both, but not including beef byproducts. The finished product shall not contain more than 30% fat. Breakfast sausage is sausage prepared with fresh and/or frozen meat, or fresh and/or frozen meat and meat byproducts. The finished product shall not contain more than 50% fat.

Italian sausage products are uncured, unsmoked

sausage containing at least 85% meat, or a combination of meat and fat, with the total fat content constituting not more than 35% of the finished product. Italian sausage also may be made with fresh and/or frozen pork, or pork and pork fat. Italian sausage also may be made with beef or beef and veal but shall be prepared so that fresh and/or frozen pork constitutes the major portion of the meat content required. Uncooked, smoked pork sausage shall not contain more than 50% fat."

This Bulletin reports analyses of fresh ground beef and sausage sold at retail stores.

Methods

Samples were collected from January 1 through December 31, 1985 by inspectors of the Food Division of the Connecticut Department of Consumer Protection. In all, 176 ground beef and 122 sausage samples were purchased and tested. All were from retail stores except two ground beef from camps and three from a hospital. Unless the label claimed a lower fat content, samples of ground beef were considered to be regular ground beef and subject to the regulation that they contain not more than 30% fat. Sausage was considered to be subject to the regulation that the product contain not more than 50% fat unless the label specifically indicated that it was Italian pork sausage and thus subject to the regulation that it contain not more than 35% fat. No beef sausage was tested.

Samples were delivered to the laboratory and either tested immediately or frozen until tested. Analyses were performed by methods described in Official Methods of Analysis (7). Fat is expressed as percentage of the finished product that was purchased.

Beef and pork contain muscle and connective tissue as well as fat. When beef is ground, the product is particulate rather than homogeneous. Thus, there is some variability in samples. Because of this inherent variability, duplicate analyses for fat are always made and the results averaged. We found an average difference of one percentage unit between duplicates with a standard deviation about their mean of 0.9 percentage units. Because of the inherent variability in sampling and in analysis, only samples found to be greater than one percentage unit above the regulated standard or above the claim stated on the label were considered to contain an excess of fat.

Results and Discussion

Ground Beef: In Table 1 the fat contents of the 176 ground beers tested, expressed as percentage of fresh weight of the finished product, are listed by vendor. Following the name of the vendor is the town

where the merchant is located or where the sample was obtained. The percentage of fat found is then shown, and those with an excess of fat are followed by a plus sign (+). If a specific claim for fat was made it is shown followed by any label declaration pertaining to a cut of meat or designation as "lean", "extra lean", or "diet lean" implying lower fat content.

Among the 176 ground beefs tested were 115 not specifying a fat content and thus subject to the regulation that they contain not more than 30% fat. These 115 ground beefs averaged 18.3% fat (Table 2). Also among the 176 ground beefs were 61 labeled as "lean", "extra lean", or "diet lean" to imply a lower fat content, and some labeled "ground chuck", "ground sirloin" or "ground round" to show cut of meat used. Samples labeled as lean averaged 19.3% fat, and those designated as extra lean or diet lean, 15% fat. Samples labeled ground chuck averaged 18.8% fat, ground sirloin, 13.2%, and ground round, 13.3%. Products specifying a cut of meat or implying lower fat content, unless also specifying a specific fat content, need only meet the requirement that the meat contain not more than 30% fat.

None of the 115 samples not claiming a fat content exceeded the standard of 30% (Table 3). On the other hand, 14 of 61 claiming a fat content less than 30% exceeded their claim. A comparison of conformity to regulated or claimed fat content in the present sampling with our sampling in 1982-1983 (Table 3) showed improvement.

Sausage: The fat contents of the 122 sausages, expressed as percentage of fresh weight of the finished product, are listed in Table 4. If the product was made in the store, the town is indicated. If it is a brand sold in many stores, then the town is not listed. The percentage of fat found is then shown, and those with an excess of fat are followed by a plus sign (+). Any label declaration follows. Eighty-one were designated as Italian sausage and subject to the 35% fat maximum allowance. Those without a label declaration and those not specifically labeled as Italian are considered to be regular sausage and subject to the 50% fat maximum allowance.

All sausage products, except one Italian sausage, met the requirements for maximum allowable fat. The average percentage of fat among all products was 24%. Sausage not specifically labeled as Italian or with no label designation averaged 25% fat with a range from 12 to 45%. Italian sausages averaged 22% with a range from 12 to 38%.

Summary

The 176 ground beef and 122 sausage samples collected in retail stores in Connecticut during 1985 were analyzed to determine if they met Connecticut and Federal Regulations pertaining to fat content.

Among 115 ground beefs subject to the regulation

that they contain not more than 30% fat, the average fat content was 18% and none contained more than the 30% allowed. Among samples designating a specific fat content, 14 of 61 exceeded their declared amount. Samples labeled as ground chuck averaged 19% fat, ground sirloin 13%, and ground round 13%. Samples labeled as lean averaged 19% fat and those labeled as

extra lean or diet lean, 15%. Among 122 sausage products examined, only one Italian sausage contained an excess of fat. All others labeled Italian were within the regulated requirement that they contain not more than 35% fat, and all those not labeled as Italian sausage had less than the 50% fat permitted under the regulations.

Table 2. Average Fat in Categories of Ground Beef.

Product	Number samples	% Fat	Range
Regular ground beef ^a	115	18.3	6.5 - 30.3
Lean ground beef	34	19.3	11.9 - 31.6
Extra lean or diet ground beef	17	15.0	7.5 - 23.5
Ground chuck	34	18.8	11.0 - 31.6
Ground sirloin	7	13.2	9.0 - 16.9
Ground round	15	13.3	5.5 - 19.4

a. Samples subject to 30% fat allowance even though they had a label declaration showing cut of meat or implying lower fat content.

Table 3. Comparison of 1985 and 1982-83 Analyses of Fat in Ground Beef.

Product	1985		1982 - 1983	
	Number samples	% With excess fat	Number samples	% With excess fat
Regular ground beef	115	0	155	2
Ground beef with % fat specified	61	23	48	42
All samples	176	8	203	11

Acknowledgments

I thank John Hayes and Vipin Agarwal for the analyses and inspectors of the Connecticut Department of Consumer Protection under the direction of John McGuire, Chief of the Food Division, for collecting the samples.
